AES Puerto Rico: Analysis of the AES coal ash aggregate by the second LEAF test (upflow column) is almost complete. ORD anticipates providing preliminary results on the column test in mid-July and a draft report on both tests in late August. We are reviewing revised EQB guidance on Agremax generation/use and will provide comments to EQB as requested by July 15, 2012. ORD is working on modeling of the LEAF results to provide groundwater contamination estimates, for which we will provide baseline parameters on risk (based on our discussions with regional risk assessor Mark Maddaloni) and hydrogeologic conditions. Once modeling is completed, we will assess our position for subsequent discussions with AES. We have had no response from AES's counsel to our May 17, 2012, response to their interrogatory on our basis for using the LEAF test, although their counsel has spoken to ORC to request a meeting, which ORC told them would occur subsequent to our receipt and evaluation of the LEAF data.
